launchsettings.json and appsettings.json and web.config

Asked 2 years ago Active 29 days ago Viewed 12k times

I have couple of confusions:

17

1

1) I published asp.net core project and I do not see launchsettings.json in bin\Release\PublishOutput, if I use Octopus then how to configure attributes based on server type?

2) Is it possible to move launchsettings.json to root folder instead of under properties?

3) If I want to use only one json like appsettings.json, can I merge both in root folder?

4) Can web.config be used instead of launchsettings.json, how?

asp.net-core

octopus-deploy

5 launchSettings.json is only for Visual Studio. Other than that, it's not clear what you're trying to do. – [Chris Pratt](#) Oct 26 '17 at 13:37

In general, it is discouraged on Stack Overflow to put more than one question in one post, With your future questions please follow this guideline :) – [Will Barnwell](#) Oct 27 '17 at 21:09

1 @Chris Pratt, I recently hosted asp core app on linux box and when I change the values of this launchSettings.json file of key applicationUrl, and hit dotnet run, hosting is configured to this value. So I think this file has its effects on dotnet run command also. If so, is this file read on CreateDefaultBuilder() method in Program.cs ? – [XPD](#) Sep 16 '18 at 17:52

When an app is launched with dotnet run: launchSettings.json is read if available. environmentVariables settings in launchSettings.json override environment variables. – [Fish](#) Aug 14 at 4:44

1. As Chris Pratt mentioned in comment, `launchSettings.json` is only used by Visual Studio. You can use [Octopus variables](#) in Octopus.
2. Don't need `launchSettings.json` for publishing an app.
3. If there are settings that your application needs to use, please store them in `appsettings.json`. This will make deployments easier, since Octopus recognizes this file by default.
4. It depends on your requirements. `web.config` is used by IIS, not by your .NET Core application directly, hence IIS limitations to what you can configure might be applied.

Hints.

- If you have some environment specific variables, you can store them in environment specific `appsettings.json`, e.g. `appsettings.Release.json`.
- You can leave placeholders for Octopus variable substitution in your `appsettings.json` file, especially in environment specific one, e.g. `appsettings.Release.json` may contain a config value like `"#{ConnectionString}"` and during deployment Octopus would substitute this placeholder with the actual value from Octopus variables.

Thanks for reply. Net Core does not have web.config, so how IIS deal with it, can IIS also read appsettings.json? – [newbeedeveloper](#) Oct 27 '17 at 6:57

If you don't have `web.config` in your project, it will be created when you publish. If you have one, it will be transformed to have correct parameters when published. See [docs.microsoft.com/en-us/aspnet/core/publishing/...](https://docs.microsoft.com/en-us/aspnet/core/publishing/) And IIS can't use `appsettings.json`, only your application can. – Ignas Oct 27 '17 at 19:59

@newbeedeveloper IIS Express should have no idea what those settings are, and Visual Studio is the bridge, [blog.lexstud.io/...](https://blog.lexstud.io/) – Lex Li Mar 30 '18 at 20:22

@Ignas if `launchSettings.json` is only for VS how can I configure `applicationurl` for each application I have on a linux server? – Offir Pe'er Sep 25 at 14:37

@OffirPe'er What do you use for publishing? Is it Octopus? Or is your application for? Are all your applications different products, is not just another instance of the
